

Brecise™

precision measuring system for surgical breast procedures

Brecise™... when you need to be precise

As an aesthetic surgeon, your goal of a perfect result for every breast procedure depends on exact pre and intra-operative measurement to guide patient skin marking. The rulers, tapes, strings and sutures currently employed to identify those measurements are unable to pinpoint these critical locations relative to fixed anatomical features.

Brecise™, a new and unique breast measuring device, has been created to easily and accurately quantify and document exact topographical locations critical to the conduct of consistent breast surgical procedures. Measurements are given in both distance and degree of angle, for best results in *all* major breast surgeries.

Comprehensive

- Ensures accurate nipple-areolar complex positioning for breast reduction, breast reconstruction, mastopexy or any other procedure where nipple removal or movement is required.
- Identifies and documents pre-operative nipple positions and asymmetries for breast augmentations.
- * Expedites pre and post operative patient skin marking.

Inexpensive

- Brecise™ is packaged and economically priced as a single use, sterile, disposable product.
